# Rectangular Weir Flow Rate Calculator Online Calculation

**calculating flow over rectangular sharp-edged weirs** - dimensional only, where a weir extends the whole width of the (rectangular) channel. a uniform flow of discharge  $q$  per unit width and depth  $d$  encounters the sharp-edged weir, whose crest at  $c$  is of height  $p$  above the bed, such that the head over the weir is  $h$ . the flow springs clear of the weir at  $c$ , which is where we place the co-ordinate ... **broad- and sharp-crested weirs** - flow upstream of the weir should be sub-critical, with an approach velocity of less than 0.5 ft/s to achieve the greatest accuracy the weir should have a span perpendicular to the flow of the channel the face of the weir should be vertical, leaning neither up or downstream **sharp crested weirs for open channel flow measurement** - sharp-crested weirs for open channel flow measurement harlan h. bentgson, phd, p.e. course content 1. introduction a weir is basically an obstruction in an open channel flow path. weirs are commonly used for measurement of open channel flow rate. a weir functions by causing water to rise above the obstruction in order to flow over it. the height of **flow over weirs by john fuller fluid mechanics lab ...** - by john fuller . fluid mechanics lab . wednesday(1-345pm) group member: abdur rahaman . abstract . the objective of this lab is to determine the characteristics of open-channel flow over, firstly, a rectangular notch and then a triangular (vee) notch, also to determine the discharge coefficients for both notches. **measuring flow in open channels (weirs)** - example - discharge over a rectangular weir problem a weir of 8m long is to be built across a rectangular channel to discharge a flow of 9m<sup>3</sup>/s. if the maximum depth of water on the upstream side of weir is to be 2m, what should be the height of the weir ? adopt  $c_d = 0.62$ . given,  $l = 8$  m  $q = 9$  m<sup>3</sup>/s depth of water = 2m  $c_d = 0.62$  **flow measurement i - lth** - rectangular broad-crested weir typical layout weir block placed in a rectangular channel perpendicular to the flow direction discharge coefficient  $c_d$  assumed constant if: 11 1 0.08 0.33 and 0.35  $h/h_p \leq \leq + c_d = 0.848$  (basic discharge coefficient) outside the limits  $c_d$  should be multiplied with a correction coefficient  $f$ . **experiment (6): flow over weirs - site.iugaza** - a rectangular notch in a thin square edged weir plate installed in a weir channel as shown in figure 4. figure 4: rectangular notch consider the flow in an element of height  $h$  at a depth below the surface. assuming that the flow is everywhere normal to the plane of the weir and that the free surface remains horizontal up to the **weir experiments, coefficients, and formulas** - weir experiments, coefficients, and formulas. by robert e. hokton. introduction. definitions of terms. the word "weir" will be used to describe any structure used to determine the volume of flow of water from measurements of its depth on a crest or sill of known length and form. in this general **lab-2: flow over a weir objectives background** - weir plate opening as the datum for your experiment 3. open the bench control valve and adjust the valve to produce a flow over the weir. ensure that the flow is large enough to prevent the outflow from the notch clinging to the notch plate 4. determine the volumetric flowrate using the bench valve by dropping the ball to fill the tank 5. **discharge characteristics of broad-crested weirs - usgs** - discharge characteristics of broad-crested weirs  $c_v v/h^p$  a.  $a^* \cdot j/l \cdot ygh/j, 'p' b' l' k' h) = 0$ . (3) it will be observed that the first of these ratios in the left member of equation 3 has the form of a froude number. under the assumed flow conditions, however, the weir is a control structure, and the froude **submerged weir flow - irrigation toolbox** - weir flow over a drop spillway is either free flow or submerged flow. free (unsubmerged weir) flow exists when the tailwater surface is at or below the crest of the weir. submerged weir flow exists when the tail- water surface is above the crest of the weir. the depth of submergence is the difference in elevation between the downstream water ... **sharp-crested weir discharge coefficient - ojceu** - weir is to determine the flow coefficient. in this study, laboratory measurements of the water surface profile, approach flow velocity and flow rate carried out over three different rectangular sharp-crested weirs **section 3. hydraulic design a. weirs and orifices** - a weir is a barrier in an open channel, over which water flows. a weir with a sharp ... as the control and, for pressure flow, is generally located at the downstream end of the conduit. two general types of controls are possible for a conduit on a mild slope, which is a **proportional weirs- introduction - nptel** - the weir has the base of a rectangular weir of width  $2w$  and height  $s$ .  $x$  and  $y$  axis are chosen as shown in figure. the weir is assumed to be symmetrical about the ordinates axis. the discharge over the rectangular weir for a depth of flow  $h$  above the origin is  $(3/2) (3/2) wd^4 qwc2ghs h^3 = + - [ ] [ ]$  in which  $cd$  is the coefficient of ...
